General Information

VPN stands for "Virtual Private Network". The VPN client is software that allows an encrypted, secure and authenticated connection from remote locations to the ETH network. Once the connection is established, you get an ETH Zurich IP address. Many ETH services do not recognize users with an Internet provider other than the ETH Zurich (e.g., Cablecom) as ETH members and therefore deny them access. With a VPN tunnel they are allocated an ETH internal address and are thus accepted by these services. The service is available to all ETH Zurich employees and students for free.

How to set up VPN

Windows, Mac OS & Linux

For Windows, Mac OS and Linux-based operating system we recommend the Cisco Secure Client from Cisco. This can be automatically installed from [https://sslvpn.ethz.ch](https://sslvpn.ethz.ch). For the login into [https://sslvpn.ethz.ch](https://sslvpn.ethz.ch) and the configuration of Cisco Secure Client use the example given below (please replace the stars*** with your ETH user name and enter your ETH network password).

For managed computers at ETH Zurich, special VPN settings may apply. Please contact your IT support group if you have any questions.

Support

Please contact us via SmartDesk, Email servicedesk@id.ethz.ch or by phone +41 44 632 77 77

Service Information

IT Service Catalogue
• Login https://sslvpn.ethz.ch

• Cisco Secure Client configuration

• Cisco Secure Client login
Attention: Linux requires that the client be installed via shell script. This script can be downloaded from the link above. Execute the command with the command: sudo sh ./anyconnect-linux64-xxx.sh

* The name of the script may be different depending on the current client version.

For the login into https://sslvpn.ethz.ch and the configuration of Cisco Secure Client use the example given below (please replace the stars*** with your ETH user name and enter your ETH network password) 📚 More information about the ETH Network Password
